

Navara Strategy — Cloud Architecture & Monthly Cost

Stakeholder summary · AWS (us-east-1) · Prepared June 2026

The platform runs on AWS and was recently re-evaluated against Azure, Google Cloud, and lighter hosting platforms. **AWS remains the most cost-effective option.** Roughly 90% of the monthly bill is the managed SFTP endpoint that external partners use to exchange files — that capability is the product, and no other provider offers it cheaper with the same per-company security isolation. Everything else is serverless: the web portal, file processing, and authentication scale to zero and cost almost nothing when idle.

Architecture at a glance

Estimated monthly cost

Component	Monthly	Notes
Managed SFTP endpoint (AWS Transfer Family)	~\$219	Always-on; core partner file exchange. ~90% of the bill.
PostgreSQL database (RDS, smallest tier + backups)	~\$16	7-day automated backups and deletion protection enabled.
Registry, secrets, logs	~\$4–6	Container images, credentials vault, 30-day log retention.
Web portal compute, CDN, sign-in	~\$0–5	Serverless, scales to zero; mostly inside AWS free tiers.
File storage & transfer (usage-based)	~\$2–8	S3 at \$0.023/GB stored; SFTP transfer at \$0.04/GB moved.
Typical month	~\$240–265	Quiet month ≈ \$240–245; active month ≈ \$250–265.

What controls this cost: the SFTP endpoint is the only significant line item. If partner SFTP usage ever winds down, removing it drops the bill to **~\$25–40/month** — partners could still exchange files through the web portal against the same storage. All other optimizations combined are worth less than \$5/month. A **\$300/month budget guardrail** is in place with email alerts at 50/80/100% of actual and forecasted spend.

Estimates use AWS us-east-1 list pricing as of June 2026 and current usage assumptions; actuals are tracked in AWS Cost Explorer with per-component cost tags. Deployments are manual-only with an approval gate; all data is encrypted at rest and in transit.
